

Serial No. 09/874,837  
Amdt. dated July 11, 2005  
Reply to Office Action of March 9, 2005

Attorney Docket No. PF02193NA

**Amendments to the Claims:**

1. (Currently Amended) A method of communicating messages with a plurality of client devices that include one or more wireless devices over a communication link, comprising:  
  
determining a link latency associated with communicating a message with at least one wireless device; and  
  
adjusting transmission timing of chat messages based on said link latency in order to synchronize communication of each chat message to the plurality of client devices messages.
2. (Original) The method of claim 1, wherein the link latency corresponds to a delay associated with communicating a message with at least one wireless device.
3. (Original) The method of claim 1, wherein the transmission timing of the chat messages is adjusted by delaying a chat message transmission in accordance with a time reference derived from the link latency.
4. (Previously Presented) The method of claim 1, wherein the transmission timing of the chat messages is delayed such that the chat messages arrive at the plurality of client devices within a particular time period.
5. (Original) The method of claim 1, wherein the link latency is determined using a low level network protocol.

Attorney Docket No. PF02193NA

6. (Original) The method of claim 1, further including:
- informing a client device with slowest link latency of a link latency of a next slowest client device;
  - transmitting a message from the client device with the slowest latency to other client devices with a delayed link latency that is based on the link latency of the next slowest client device; and
  - displaying a chat message originated at the client with slowest latency after a delay that accounts for the delayed link latency.
7. (Original) The method of claim 1, wherein said latency measurement is repeated over time.

Attorney Docket No. PF02193NA

8. (Currently Amended) A communication system that communicates chat messages with a plurality of client devices wireless device over a communication link, comprising:

a chat server that creates a chat room session for the plurality of client devices;

a wireless network that communicates messages addressed to at least one wireless device,

wherein the chat server determines a link latency associated with communicating a message with the at least one wireless device and adjusts transmission timing of chat messages based on said link latency in order to synchronize communication of each chat message to the plurality of client devices messages.

9. (Original) The communication system of claim 8, wherein the link latency corresponds to a delay associated with communicating a message with at least one wireless device.

10. (Original) The communication system of claim 8, wherein the transmission timing of the chat messages is adjusted by delaying a chat message transmission in accordance with a time reference derived from the link latency.

11. (Previously Presented) The communication system of claim 8, wherein the transmission timing of the chat messages is delayed such that the chat messages arrive at the plurality of client devices within a particular time period.

12. (Original) The communication system of claim 8, wherein the link latency is determined using a low level network protocol.

Attorney Docket No. PF02193NA

13. (Original) The communication system of claim 8, wherein a client device with the slowest link latency is informed of a link latency of a next slowest client device, wherein the chat server transmits a message originated from the client device with the slowest latency to other client devices with a delayed link latency that is based on the link latency of the next slowest client device.

14. (Previously Presented) The communication system of claim 8, wherein said latency measurement is repeated over time.
